

Q1 2020

PRODUCT RATING

BBB

Overview & Outlook

During Q1, 2020, NSS Labs performed an independent test of the Panda Adaptive Defense 360 3.60.00 Windows protection: 8.00.15.0030.

Comprehensive management. Overall protection adequate; low false positive rate; excellent resistance to evasion. Good malware protection; excellent protection against drive-by exploits. Some room for improvement defending against social exploits and handcrafted (targeted) attacks.

MANAGEMENT

AA

Initial configuration of the Panda Adaptive Defense 360 was straightforward and ongoing operational tasks were easy to carry out.

The management console supports extensive role-based access control (RBAC). LDAP, Active Directory (AD) or SAML authentication are not supported; however, organizations with an AD server installed on their network, can use the Panda Adaptive Defense 360 to automatically obtain and replicate the configured AD structure. We found it to be straightforward to define and save multiple security policies, which we applied to specific users and groups. The policy mechanism supports a range of use cases, enabling true customization. The system can add custom rules, and white-list and black-list to build custom policies that can be applied to machines, users, and groups of machines/users. Inheritance (nested rules) is fully supported. Logging is robust, and standardized logging and reporting formats facilitated fast, accurate consumption of data. The system provided built-in reports, including industry-standard reports for compliance, as well as the ability to generate custom reports.

FALSE POSITIVE RATE 7/645 (1.1%) A

With a false positive rate of 1.1%, the Adaptive Defense 360 is unlikely to introduce much additional work for administrators.

RESISTANCE TO EVASION

49/49 (100%) AAA

The endpoint protection was capable of detecting and blocking malware and exploits when subjected to numerous evasion techniques.

BLOCK RATE

2,056/2,282 (90.10%) CC

| ATTACKS | RATING | BLOCKED ON DOWNLOAD | BLOCKED ON EXECUTION | TOTAL BLOCKED | DETECTED | UNBLOCKED & UNDETECTED |
|---------------------|------------|---------------------|----------------------|---------------|-----------|------------------------|
| Email Malware | CCC | 568 | 765 | 1,333 | 31 | 167 |
| HTTP Malware | AA | 395 | 24 | 419 | 2 | 3 |
| Drive-by Exploits | AA | 239 | 10 | 249 | 4 | 3 |
| Social Exploits | BBB | 24 | 14 | 38 | 2 | 10 |
| Handcrafted Attacks | A | 2 | 15 | 17 | - | 4 |
| TOTAL | BBB | 1,228 | 828 | 2,056 | 39 | 187 |
| | | 90.01% | 1.71% | 8.19% | | |

Results indicate that the product is capable of protecting against most classic malware attacks and is effective at blocking drive-by exploits. Protection against handcrafted (targeted) attacks was strong, but the product underperformed against social exploits.

Security

The threat landscape is evolving constantly; attackers are refining their strategies and increasing both the volume and complexity of their attacks. Enterprises now are having to defend against everyday cybercriminal attacks as well as targeted attacks and even the rare advanced persistent threats (APTs). For this reason, we tested using multiple commercial, open-source, and proprietary tools to employ attack methods that are currently being used by cybercriminals and other threat actors. We increased the levels of difficulty as we tested, beginning with common attacks, escalating to targeted attacks, and then applying obfuscation techniques to see if we could evade defenses. We then recorded whether the endpoint protection blocked and logged threats accurately and how frequently it triggered false positives.

Tuning and False Positives

This test includes a varied sample of legitimate application traffic that may be falsely identified as malicious (also known as false positives). As part of the initial setup, we tuned the endpoint protection as it would be by a customer. Every effort was made to eliminate false positives while achieving optimal security effectiveness and performance, as would be the aim of a typical customer deploying the device in a live network environment. To ensure that the vendor did not deploy unrealistic (overly aggressive) security policies that blocked access to legitimate software and websites, we tested the endpoint protection against 645 false positive samples, including but not limited to the following file formats: .exe, .jar, .xls, .xslm, .accdb, .css, .pdf, .doc, .docx, .zip, .DLL, .js, .xls, .chm, .rar, .lnk, .cur, .xrc., .slk, .ppt, pptx, .iqy, .htm.

Figure 1 – False Positives

Resistance to Evasions

Threat actors apply evasion techniques to disguise and modify attacks at the point of delivery in order to avoid detection by security products. Therefore, it is imperative that endpoint protection correctly handles evasions. If an endpoint protection platform fails to detect a single form of evasion, an attack can bypass protection.

Our engineers verified that the endpoint protection was capable of detecting and blocking malware when subjected to numerous evasion techniques. To develop a baseline, we took several attacks that had previously been detected and blocked. We then applied evasion techniques to those baseline samples and tested. This ensured that any misses were due to the evasions and not the underlying (baseline) attacks.

Figure 2 – Resistance to Evasions

For example, we applied an evasion technique called *process injection* where the original file is extracted from the binary and code is injected into a legitimate/trusted target process (i.e., Google Chrome). The malicious execution then occurs under the context of the target process (Chrome). Once these process injections techniques ran, we tried to further elude the detection by introducing anti-sandbox/anti-discovery evasions that employed techniques to determine whether or not the malware was on a user's machine; whether or not a security product was present; whether or not debugging or sandboxing was occurring; etc.

| | Blocked | Detected | Missed | Rating |
|-------------------------------------|---------------------|-----------------|-------------------|--------|
| Malware Delivered over Email | 1,333/1,531 (87.1%) | 31/1,531 (2.0%) | 167/1,531 (10.9%) | CCC |

One of the most common ways in which users are compromised is through malware delivered over email. For several years, the use of social engineering has accounted for the bulk of cyberattacks against consumers and enterprises. Socially engineered malware attacks often use a dynamic combination of social media, hijacked email accounts, false notification of computer problems, and other deceptions to encourage users to download malware. One well-known social engineering attack method is spear phishing. Cybercriminals use hijacked email accounts to take advantage of the implicit trust between contacts and deceive victims into believing that the sender is trustworthy. The victim is tricked into opening the email attachment, which then launches the malicious malware program.

Figure 3 – Malware Delivered over Email

To test how well the endpoint protection is able to protect against this type of attack, malware was emailed to the user. The desktop client then retrieved the email and opened/executed the malware. If the malware was blocked, the corresponding time was recorded. We deployed a CentOS 7.7.1908 Linux mail store with kernel 3.10.0-957.5.1.el7.x86_64 running Dovecot v2.2.36 for IMAP as the mail server. Victim machines consisted of a combination of 32-bit and 64-bit Windows 7 endpoints and 64-bit Windows 10 endpoints.

| | Blocked | Detected | Missed | Rating |
|------------------------------------|-----------------|--------------|--------------|--------|
| Malware Delivered over HTTP | 419/424 (98.8%) | 2/424 (0.5%) | 3/424 (0.7%) | AA |

One of the more widespread threats to the enterprise involves attackers using websites to deliver malware. In these web-based attacks, the user is deceived into downloading and executing malware. For example, an employee may be tricked into downloading and installing a malicious application that claims it will “speed up your PC.”

In cases where an attacker is aiming for a large number of victims, the attacker may hijack widely used reputable websites to distribute the malware. However, in cases where an attacker plans to target specific individuals, the attacker typically would use an industry-specific “watering hole” plus one or more social engineering techniques to deceive a user into unknowingly installing malware.

Figure 4 – Malware Delivered over HTTP

We tested the capability of the endpoint protection to protect against malware that was downloaded over HTTP and then executed (if the download was not blocked) using 424 malware samples against live victim machines running a combination of 32-bit and 64-bit Windows 7 endpoints and 64-bit Windows 10 endpoints, with various versions of Google Chrome, Mozilla Firefox, Microsoft Internet Explorer, and Microsoft Edge. Browser reputation systems were disabled so that the endpoint protection was not inadvertently credited for protection offered by a web browser.

Drive-by Exploits

| Blocked | Detected | Missed | Rating |
|-----------------|--------------|--------------|--------|
| 249/256 (97.3%) | 4/256 (1.6%) | 3/256 (1.2%) | AA |

While there are millions (or hundreds of millions) of malware samples in circulation at any given point in time, they are frequently delivered by exploits that target consumer desktops known as drive-by exploits.

In a drive-by exploit, an employee visits a website containing malicious code that exploits the user's computer and installs malware without the knowledge or permission of the user. An example of this would be where an employee visits WSJ.com (Wall Street Journal), which is inadvertently hosting an advertisement that contains an exploit. Another example (that we frequently observe in the wild) is where a user navigates to a URL and then is re-directed without interaction to a web page serving malicious content. Using this technique, a single exploit can silently deliver and install millions of malware samples to unsuspecting victims' computers.

Figure 5 – Drive-by Exploits

To test how well the solution was able to protect against drive-by exploits, victim machines were deployed running 32-bit Windows 7 (version 6.1 (Build 7601: SP1) and 64-bit Microsoft Windows 10 (version 1709 (Build: 16299.15) with Microsoft Office (Office 16.0.7341.2032) and various versions of Google Chrome, Mozilla Firefox, Microsoft Internet Explorer, and Microsoft Edge. Depending on the victim machine, one or more of the following applications was installed: Java 8 Update 231, Microsoft Silverlight 5.1.20125, Adobe Flash Player 18.0.0.160, Adobe Reader DC 2017.012.20093, Adobe Reader 9.40, Java 6 Update 27, Adobe Flash Player 32.0.0.238, Java 8 Update 221, Microsoft Silverlight 5.1.50918, Adobe Flash Player 32.0.0.223, Java 8 Update 211, Adobe Flash Player 32.0.0.207, Internet Explorer 11, Internet Explorer 10, and Internet Explorer 9. Browser reputation systems were disabled so that the endpoint protection was not inadvertently credited for protection offered by a web browser.

While vulnerabilities are patched and defenses against exploits incorporated into new versions of operating systems (i.e., Windows), many organizations cannot easily upgrade due to financial, technical, or other constraints. As of January 2020, NetMarketShare¹ reports OS market share for Windows 7 (released 11 years ago in 2009) at 25.56% and for Windows 10 (released in 2015) at 57.08%.

Research has shown that oftentimes the most valuable assets have the most stringent change control to avoid business interruption. This creates a challenging dynamic whereby the most valuable assets tend to be the most difficult to defend (e.g., older OS, unpatched, etc.). Therefore, as vulnerabilities are patched and defenses against exploits are incorporated into new versions of operating systems (i.e., Windows)—which makes exploitation of computers more difficult—the value of endpoint protection is often associated with its ability to protect older, unpatched, and generally more vulnerable systems.

¹ <https://netmarketshare.com>

Social Exploits

| Blocked | Detected | Missed | Rating |
|---------------|-------------|---------------|--------|
| 38/50 (76.0%) | 2/50 (4.0%) | 10/50 (20.0%) | BBB |

Social exploits combine social engineering (manipulating people into doing what you want them to do) and exploitation (malicious code designed to take advantage of existing deficiencies in hardware or software systems, such as vulnerabilities or bugs). An example of this would be an email with “Your Bonus” as a subject line and containing a malicious spreadsheet labeled “bonus.xlsx” (which the employee opens).

As with drive-by exploits, these attacks are limited to specific operating systems and/or applications. However, the exploits contained within Excel spreadsheets or Word documents may target kernel functions or common functions such as object handling, which provides attackers with a wide attack surface. As such, sending social exploits through mass email (phishing), could yield profit as the number of victims would be large, albeit smaller than in the case of malware since exploits would have technical dependencies.

Figure 6 – Social Exploits

To test how well the product was able to protect against social exploits, we deployed 19 victim machines. All of the machines were running Windows 10 version 1709 (OS Build 16299.15). Machines were configured with Internet Explorer 11 (version 11.15.16299.0 – Update Version 11.0.47) and Microsoft Office 2016 (version 16.0.7431.2032).

Handcrafted (Targeted) Attacks

| Blocked | Detected | Missed | Rating |
|---------------|----------|--------------|--------|
| 17/21 (81.0%) | - | 4/21 (19.0%) | A |

The aim of this test was to see which endpoint products were able to protect customers while under adverse conditions dictated by the attacker. In this case, we wanted to find out which products could block new handcrafted (unknown) malware while being prevented from accessing cloud services.

What happens, for example, if an employee goes on a business trip to China where Internet traffic is tightly controlled? In such a scenario, access to the corporate VPN is likely blocked and the security software on the employee’s laptop may not be able to receive updates or communicate in general. What happens if the employee’s laptop is attacked with targeted malware?

Figure 7 – Handcrafted (Targeted) Attacks

For the purposes of this test, handcrafted (targeted) malware was created by modifying the source code of keyloggers, ransomware, and destructware, and then recompiling the binary so that it was new to the products being tested. We then attempted to infect a host (e.g., a laptop) with the malware and recorded whether or not the endpoint protection blocked the attack.

Because creating samples in this manner is a painstaking and time-consuming exercise, we tested only a handful of targeted samples; results should be viewed with this in mind.

Panda provides a cloud-based management console that is accessible from a variety of supported web browsers.

Management & Reporting Capabilities

Rating

AA

Authentication

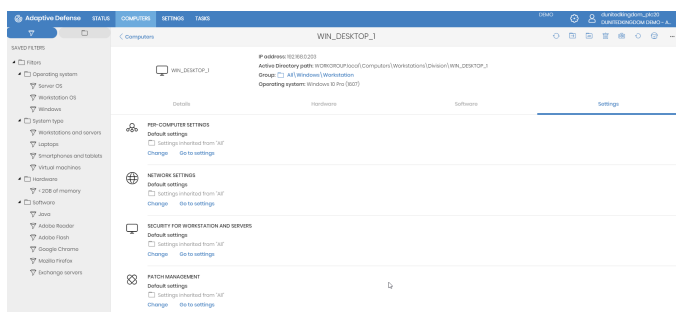

The console fully supports role-based access control (RBAC). A centralized management user is assigned a role (e.g., full control, read only, etc.) and a group of users to manage (domain and subdomains as needed).

Permissions are defined for each role. A permission regulates the access is given to each role. Examples include the ability to manage users and roles; assign licenses; add, discover, and delete computers; modify network settings (proxies and cache); configure per-computer settings (updates, passwords, etc.); restart computers and reinstall the protection; isolate computers; view and configure security for workstations and servers; view and configure security for Android devices; use the anti-theft protection for Android devices (locate, wipe, lock, etc.); view detections and threats; view access to web pages and spam; launch scans and disinfect; configure patch management, etc. Each role can be assigned to multiple user accounts.

LDAP, Active Directory (AD), or SAML authentication is not supported; however, for organizations with AD servers installed on their network, Panda can automatically obtain the configured AD structure and replicate it in its group tree.

Policy

The policy mechanism is diverse and supports a wide range of use cases, enabling true customization. The system can add custom rules and white-list and black-list to build custom policies that can be applied to machines, users, and groups of machines/users.

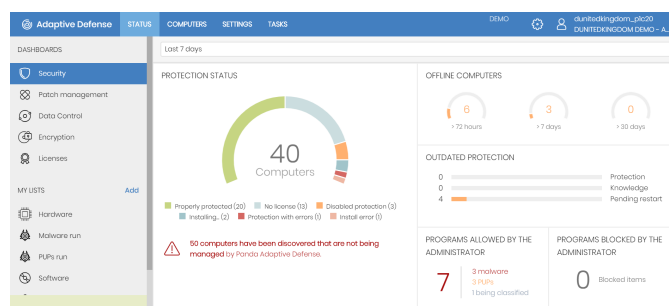

Inheritance (nested rules) is fully supported, including creation of groups and sub-groups such that sub-groups can inherit certain aspects of configuration and policy definition from parent groups.

An unlimited number of policies are supported. The policy menu has multiple sections (general policy settings, advanced protection, antivirus, firewall, device control, web access control and antivirus, anti-spam, and content filtering for Microsoft Exchange), which are further divided into sub sections.

Logging

Malicious traffic from the endpoints is logged centrally and displayed in UTC. Session login and logout is recorded, with date and time stamps. Successful administrative authentication statuses are logged, but unsuccessful authentication attempts are not. Policy changes and deployments are logged centrally. The “Protection Status” section of the CMS depicts the overall status of all of the endpoints running.

More specifically, “Protection Status” displays whether endpoints are properly protected, in progress/pending installation, licensing issues, disabled protections, disabled modules, or installation errors. The management console and the Advanced Reporting Tool display the life cycle of any attack. Logs are stored for 365 days.

Change Control

The CMS logs every action taken by network administrators, which allows them to track which user made which changes. Revision history and rollback are not supported.

Alert Handling

All alerts pertaining to malicious activities are aggregated in a single management console; however, to drill into the threat data in detail, the administrator must open Panda's Cytomic Orion cloud reporting.

| Computer | Threat | Path | Action | Date |
|---------------|------------|------------------------------|---------|---------------------|
| WIN_LAPTOP_1 | W32/Adware | \\FS01\server\2020\10\10\... | Deleted | 2020/10/10 10:10:10 |
| WIN_LAPTOP_2 | W32/Adware | \\FS01\server\2020\10\10\... | Deleted | 2020/10/10 10:10:10 |

| WIN_LAPTOP_4 | W32/Adware | \\FS01\server\2020\10\10\... | Deleted | 2020/10/10 10:10:10 |
| WIN_LAPTOP_5 | W32/Adware | \\FS01\server\2020\10\10\... | Deleted | 2020/10/10 10:10:10 |
| WIN_LAPTOP_6 | W32/Adware | \\FS01\server\2020\10\10\... | Deleted | 2020/10/10 10:10:10 |
| WIN_LAPTOP_7 | W32/Adware | \\FS01\server\2020\10\10\... | Deleted | 2020/10/10 10:10:10 |
| WIN_LAPTOP_8 | W32/Adware | \\FS01\server\2020\10\10\... | Deleted | 2020/10/10 10:10:10 |
| WIN_LAPTOP_9 | W32/Adware | \\FS01\server\2020\10\10\... | Deleted | 2020/10/10 10:10:10 |
| WIN_LAPTOP_10 | W32/Adware | \\FS01\server\2020\10\10\... | Deleted | 2020/10/10 10:10:10 |

The cloud-first web-console provides SOCs and MDR providers with tools to detect, investigate, and contain attacks using Living-off-the-land (LotL) techniques. Administrators can use Cytomic Orion to further summarize a data field or correlate data by querying the following values: date, hash, threat, user, computer, path, accessed data, action, command line, event date, path, URL, registry keys/values, IP, port, file hash, and protocol. Alert suppression and incident workflow are not supported.

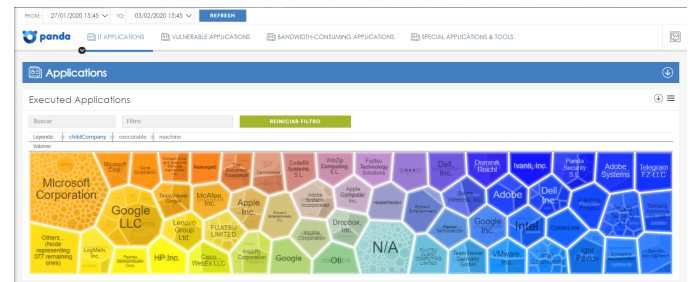

Reporting

The management console generates various reports, including license status, network security status, detections, classification of applications, PUP activity, exploit activity, latest malware detections, latest PUP detections, latest exploit detections, threats detected by antivirus, etc. Reports can be scheduled, daily, weekly, or monthly and can query time ranges from the last 24 hours up to the last year.

Administrators can also generate executive reports that produce data for all computers in the environment, not just specific groups.

Templatized executive reports can be generated for security incidents, access to critical information, application/network usage, calendar charts showing threats detected over a time range, endpoints with most infection attempts, endpoints with

most malware specimens detected, endpoints with vulnerable applications, and threat execution status.

Although the management server does not natively export to SIEM, administrators can run Panda's SIEMFeeder application on an endpoint to facilitate SIEM export.

SIEMFeeder locates unknown threats, targeted attacks, and advanced malware (advanced persistent threats), providing deeper visibility into processes across the organization's IT structure. The application does this by collecting information about the activity of every application run across the IT network, using the continuous monitoring provided by Adaptive Defense. This information is combined with security intelligence generated at Panda Security and sent to the customer's SIEM platform, where it is integrated for exploitation.

Total Cost of Ownership (TCO)

Implementation of security solutions can be complex, with several factors affecting the overall cost of deployment, maintenance, and upkeep. All of the following should be considered over the course of the useful life of a product:

- **Initial Purchase** – The cost of acquisition
- **Maintenance/Subscription** – Fees paid to the vendor for ongoing use of software and access to updates
- **Technical Support** – Fees paid to the vendor for 24/7 support

3-Year Total Cost of Ownership

Calculations are based on vendor-provided pricing information. Where possible, the 24/7 maintenance and support option with 24-hour replacement is used, since this is the option typically selected by enterprise customers. Prices include the purchase and maintenance costs for 2,500 software agents

- **Year 1 Cost** is calculated by adding purchase price + first-year maintenance/support fees.
- **Year 2 Cost** consists only of maintenance/support fees.
- **Year 3 Cost** consists only of maintenance/support fees.

| Expected Costs for Panda Adaptive Defense 360 – 2,500 Agents | |
|--|-----------|
| Initial Purchase Price | \$144,000 |
| Annual Cost of Support/Maintenance | \$0 |
| Other Annual Cost (AV, IPS, Cloud etc.) | \$0 |
| | |
| 3-Year Total Cost of Ownership | \$144,000 |
| Total Cost Year 1 | \$144,000 |
| Total Cost Year 2 | \$0 |
| Total Cost Year 3 | \$0 |

Figure 8 – 3-Year TCO (US\$)

Appendix

| NSS LABS RATINGS | |
|------------------|---|
| RATING | DEFINITION |
| AAA | A product rated 'AAA' has the highest rating assigned by NSS Labs. The product's capacity to meet its commitments to consumers is extremely strong. |
| AA | A product rated 'AA' differs from the highest-rated products only to a small degree. The product's capacity to meet its commitments to consumers is very strong. |
| A | A product rated 'A' is somewhat more susceptible to sophisticated attacks than higher-rated categories. However, the product's capacity to meet its commitments to consumers is still strong. |
| BBB | A product rated 'BBB' exhibits adequate protection parameters. However, sophisticated or previously unseen attacks are more likely to negatively impact the product's capacity to meet its commitments to consumers. |
| | A product rated 'BB,' 'B,' 'CCC,' 'CC,' and 'C' is regarded as having significant risk characteristics. 'BB' indicates the least degree of risk and 'C' the highest. While such products will likely have some specialized capability and protective characteristics, these may be outweighed by large uncertainties or major exposure to adverse conditions. |
| BB | A product rated 'BB' is less susceptible to allowing a compromise than products that have received higher-risk ratings. However, the product faces major technical limitations, which could be exposed by threats that would lead to its inability to meet its commitments to consumers. |
| B | A product rated 'B' is more susceptible to allowing a compromise than products rated 'BB'; however, it currently has the capacity to meet its commitments to consumers. Adverse threat conditions will likely expose the product's technical limitations and expose its inability to meet its commitments to consumers. |
| CCC | A product rated 'CCC' is currently susceptible to allowing a compromise and is dependent upon favorable threat conditions for it to meet its commitments to consumers. In the event of adverse threat conditions, the product is not likely to have the capacity to meet its commitments to consumers. |
| CC | A product rated 'CC' is currently highly susceptible to allowing a compromise. The 'CC' rating is used when a failure has not yet occurred but NSS Labs considers a breach a virtual certainty, regardless of the anticipated time to breach. |
| C | A product rated 'C' is currently highly susceptible to allowing a compromise. The product is expected to fail to prevent a breach and to not have useful forensic information compared with products that are rated higher. |
| D | A product rated 'D' is actively being breached by known threats and is unable to protect consumers. For non-specialized products, the 'D' rating category is used when protecting a consumer is unattainable without a major technical overhaul. Unless NSS Labs believes that such technical fixes will be made within a stated grace period (often 30-90 calendar days), the 'D' rating also is an indicator that it is a virtual certainty that existing customers using the product have already experienced a breach—whether they know it or not—and should take immediate action. |
